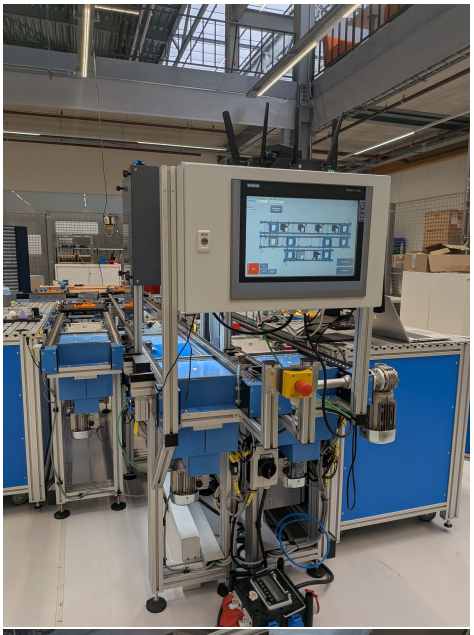
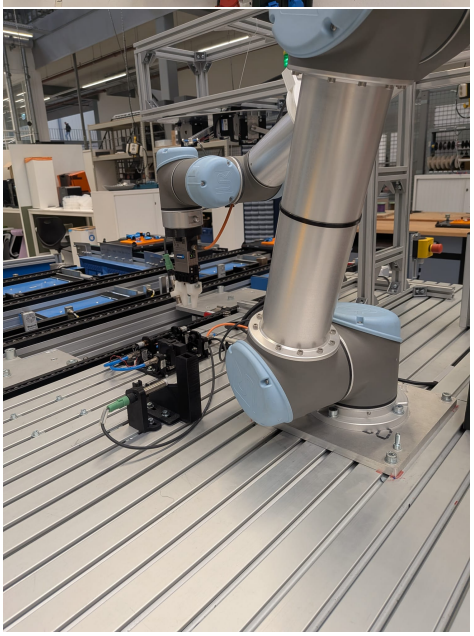
1 The Experience

I registered for the event because I would like to experience being there and to know more about the Smart Industy field - what they do, why they do things, and how they do things. I came late because I had to present my poject 1 to the class and due to some technical issues, I ended up presenting last.

On a positive note, I made it there for the last part of Workshop 1 - Exploring a simple SmartIndustry system, where we were introduced to higher year Fontys students doing an actual project for a company and saw a mini car factory run by siemens PLC - if I understood it correctly.





It was such a nice experience. After that information session, we had lunch and proceeded to do a short tour while waiting for the next activity which was the presentation of "Low-Coding" by Cordis. In that presentation, I learned that a project doesn't have to be complicated, as long as you know your goal, you understand what you need, you can work on a project with little coding needed. That was good to know for someone like me who has very little experience in coding and who prefers to look at the data and an-

alyze it to solve problems.

Unfortunately, after the presentation, I had to leave and sit somewhere to make a snapshot of my portfolio so I can submit it on time. I was able to submit it on time, but I missed the last part of the program. That was very disappointing considering that I showed up there to learn and I fell short fo coming late and leaving early.

If given the chance to do it again, I will make sure to finish and submit my portfolio ahead of time so I will be able to fully enjoy the learning this activity offers.
